

Presentation Overview:

The recorded presentation should be an 8–15 minute screen recording that provides a concise overview of your project, including the background, methods, and results. A formal slide **presentation** is **not** required. In most cases, the presentation can be delivered effectively by **walking** through your **ABAQUS model** and explaining the key aspects of your work. You may choose to support your presentation with a few slides or figures from your report, but this is **optional**. A full grade can be achieved through a clear and well-explained walkthrough of your ABAQUS model alone.

Recorded Presentation Weight: 10%**Structure:**

- **1-2 Minutes: Introduction**
 - Introduce the problem and explain its importance.
- **4-6 Minutes: Methods**
 - Overview of the system geometry
 - Focus mainly on the major dimensions
 - Highlight any critical locations of interest, if applicable.
 - Overview of the material properties
 - Describe the material assignment for each component, if applicable
 - State the material model used, for example:
 - Linear Elastic Isotropic
 - Elastic-plastic
 - Linear Elastic Orthotropic
 - Interaction between different components (if applicable)
 - Mention the type of Simulation: Static, Dynamic and etc
 - Mesh:
 - Show the mesh
 - Mention the element type
 - Indicate if there are any specific critical areas that required special attention
 - Load and Boundary:
 - Mention the loads and boundary conditions
- **3-5 Minutes: Results:**
 - Highlight the most significant results, this can include
 - x-y Plots
 - Contour Plots
 - Animations
 - Any other relevant outputs
 - Briefly discuss if the results are matching your expectations

- If they do not, comment on possible sources of discrepancy
- **1-2 Minutes:** Concluding Remarks:
 - Briefly conclude with your main findings
 - Briefly mention any limitations or future work

Screen Recording Options

Windows

- [Snipping tool](#)
- [PowerPoint](#)

Mac OS

- [Quicktime](#)

These are some tools you may consider using, but you are free to use any screen-recording tool as long as the video and audio quality are clear.

Grading Rubric

Item	Criteria	Points
Introduction (1 Pt)	Clearly introduces the problem and explains its importance	1
	Introduction is unclear or missing key context	0.5
	Missing	0
Methods (3 Pts)	Clearly explains the main aspects of the model, including geometry, materials, simulation type, mesh, and loads/boundary conditions	3
	Explains most aspects of the model but some elements are unclear or missing	2
	Limited explanation of the model setup	1
	Missing	0
Results (3Pts)	Results are clearly presented and interpreted using appropriate plots, contours, or animations	3
	Results are presented but interpretation is limited	2
	Results are shown but poorly explained	1
	Missing	0
Conclusion (1 Pt)	Clearly summarizes the main findings and mentions limitations or future work	1
	Conclusion is present but limited	0.5
	Missing	0
Clarity and Organisation (2 Pts)	Presentation is clear, well organized, easy to follow, and stays within the expected time range	2
	Presentation is generally clear and organized but has minor issues with flow, clarity, or timing	1
	Presentation is difficult to follow, poorly organized, or significantly outside the expected time range	0
